

PRESS RELEASE

Environics introduces new Handheld Chemical Detector

Environics has launched its new handheld chemical detector, ChemProX, for detection and classification of CWA's and TIC's at NCT Europe 2019 in Vienna, Austria.

ChemProX represents the next generation of chemical detectors, enabling full situational awareness during field operations. The device has been developed together with First Response professionals with its technological foundation based on 30 year of experience in chemical detection. ChemProX includes wireless connectivity and training capabilities as standard features, providing a broad experience within a single device.

As operators are not alone in the field, shared real-time location and detection information between the team members and the Command Centre can be crucial for a successful result. In addition to wireless connectivity capabilities the detector also has a built-in simulation mode, allowing the creation of various realistic training scenarios without endangering the users.

"ChemProX is absolutely the best chemical detector I have ever used. It's easy, simple, and logical."
CBRN Sergeant , Finnish Defence Forces
